

Gr. 5 Species at Risk

1. Name one physiogeographic region in Canada and describe what it is like there—what is the landscape like and what sorts of natural features (mountains, hills, lakes, forests, etc.) are found there? Name one Alberta animal that lives in the ecozone you chose.

2. Name 3 natural resources found in Alberta. Choose one of them and explain how humans trying to get this natural resource harms the environment and animal habitats. How does having parks protect the environment?

3. What are 3 things that are harming Alberta's animals and putting them at risk for extinction? One thing must be related to the topic of "wetlands".

4. Explain why wetlands are important to the survival of whooping cranes.

5. Looking at the photos of the animals below, describe one adaptation for each one and explain how it helps the animal to survive in its wetland habitat.

Northern Leopard Frog

Whooping Crane

Water Strider

6. What are three things that YOU can do to help Alberta's species at risk? One thing must be related to water conservation/wetlands.

Thank you for being a champion of Alberta's species at risk!
